10 septembre 2026

The rapid development and deployment of Agentic AI systems raises several concerns that go unaddressed by current ethics or legal frameworks, unless their outcome becomes apparent. The OpenAI-Hugging Face incident is only one example of an agentic AI systems breaking the law by intruding into the infrastructure of an organization. It raised plenty of discussions and concerns mainly because of its cybersecurity character. But there are several ethics principles that Agentic AI systems don't align with, and therefore such incidents and others of diffent nature are bound to happen. This talk explores this mismatch between Agentic AI and ethics guidelines, specifically those issued by the EU's HLEG-AI and that are foundational of the AI Act. It also questions the completeness of these principles.
